

A fully-managed and hosted enterprise web GIS, eliminating the need for costly desktop software and IT infrastructure

Features

- Fully hosted and maintained infrastructure
- Instant access to our extensive catalogue of fully managed third-party datasets
- Rich suite of GIS tools for querying, viewing, printing and exporting data
- INSPIRE compliant metadata and OGC compliant data services
- System administrator and reporting tools

Benefits

- Data security, resilience and disaster recovery
- Reduced data management overheads
- A single system for all users, reducing complexity and cost
- Integrate with other standards compliant systems ie. desktop GIS
- Cost effective, easy to deploy and administer

About

A web based GIS ideal for large, complex organisations. Location Centre™ provides a rich suite of GIS tools and easy access to base mapping and other geographic business data. A cost-effective solution as an intranet GIS, with advanced capabilities for creating web maps and reports for public facing websites.

Location Centre™ provides a fully hosted national data store of up-to-date open and commercial datasets such as those provided by the Ordnance Survey under the Public Sector Mapping Agreement (PSMA) and the One Scotland Mapping Agreement (OSMA).

“This entire project was about reducing risk by giving users across the organisation easy access to accurate, current and consistent data.”

Web GIS (Intranet)

Location Centre™ provides an intranet GIS with rich browser-based functionality including querying, viewing, printing and exporting. Simply add your own business data to use alongside environmental, demographic and topographic datasets hosted by thinkWhere.

Location Centre™ allows you to easily share a common view of business information across your organisation supported by full access rights management. Aspects of the system can be customised and configured to suit the needs of your organisation.

Web Maps (Internet)

Create easy-to-use interactive online maps and reports and publish them on your website. Responsively designed for use on mobile devices, Web Maps offer simple query, view and print functions.

There are a number of different Web Map templates available, that are easily integrated within standard websites and many common Content Management System technologies.

Data Services

Access an extensive suite of maintained environmental, demographic and topographic datasets hosted by thinkWhere as WFS, WMTS and WMS OGC compliant data services.

Also allows you to store and access your own business data, for serving to desktop GIS applications, internal systems or custom web mapping applications.
